There are six different types of solids: metallic solids, ionic solids, covalent network solids, molecular solids, polymers, and nanomaterials. We won't discuss nanomaterials in this class. We'll discuss polymers later an. Metals are bonded together through metallic bonds, in which the valence electrons are delocalized throughout the entire

To predict if a compound or element will have metallic properties, you need to consult the periodic table. If the compound is a metallic element or an alloy (two or more metals bonded together), then it will have

metallic properties. If not, then it won't.
